

Crooked mirror

X18 (2018) — English translation

Two parallel plane mirrors are located at a distance D from each other, the length of the mirrors is much greater than D . A beam of light with an angle of incidence $\alpha_0 \ll 1$ рад is launched into the space between the mirrors. One of the mirrors bends slightly inward, taking on the shape of a circular arc.

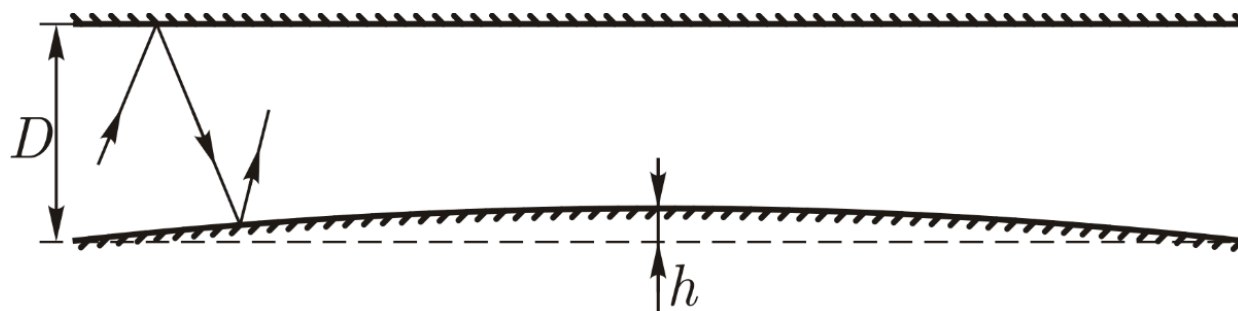

Fig. 1.

A1 At what maximum deflection value h will the beam still exit the system from the opposite side? **5.00**

side?
