

Close lenses

X21 (2021) — English translation

The optical system consists of a large number of collecting lenses with a focal length F with a common main optical axis. The centers of adjacent lenses are at the same distance $d \ll F$ from each other, and the thickness of the lens can be neglected compared to d . The ray, before refraction in the center of the first lens, intersects the main optical axis at an angle of $\alpha \ll 1$, and immediately after refraction in the last one, it intersects the main optical axis at the same angle.

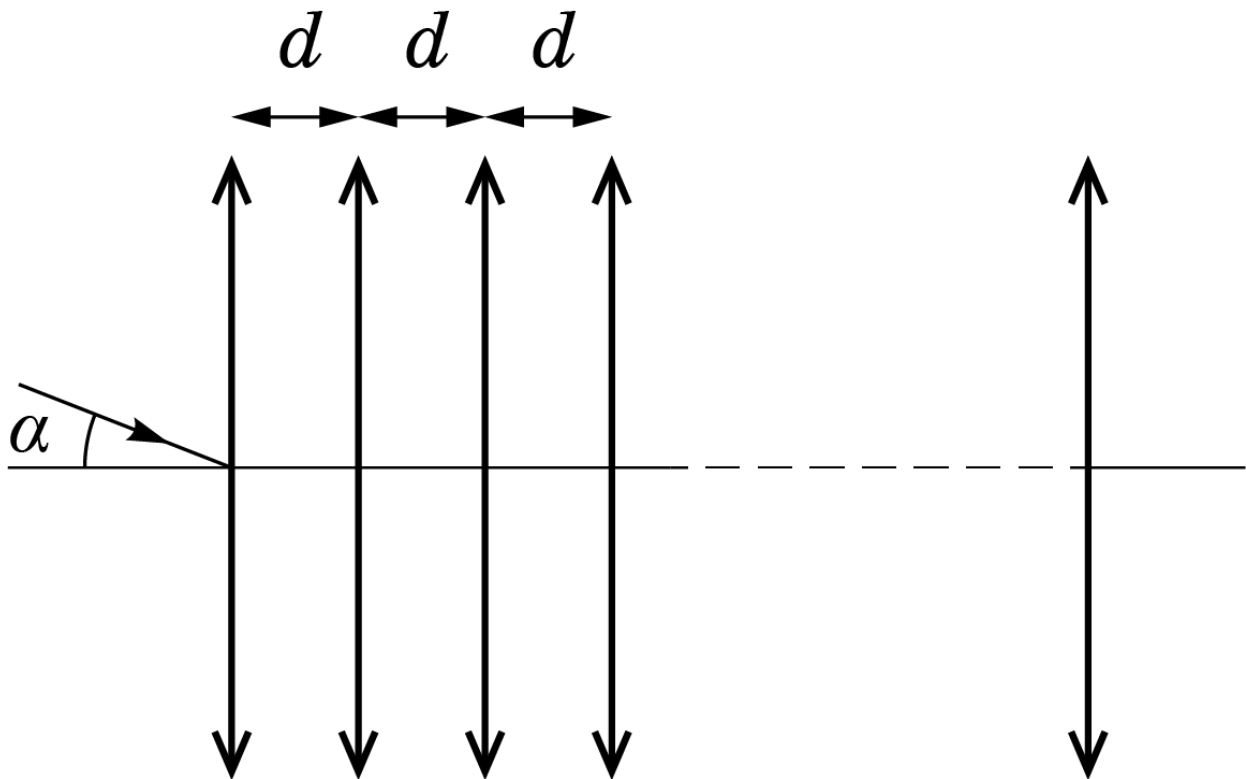

Fig. 1.

A1 Find the minimum possible distance L between the outer lenses.
