

Rocket flight

Y16 (2016) — English translation

A space rocket rotates in a circular orbit at a distance $R = 2.0 \cdot 10^7 \text{ m}$ from the center of the Earth in the plane of the Earth's orbit. Earth mass $m = 6.00 \cdot 10^{24} \text{ kg}$, Sun mass $M = 2.0 \cdot 10^{30} \text{ kg}$, Earth orbital radius $R_0 = 1.5 \cdot 10^{11} \text{ m}$, gravitational constant $G = 6.67 \cdot 10^{-11} (\text{H} \cdot \text{m}^2)/\text{kg}^2$.

A1	Find the minimum value of the change in speed Δv of the rocket, which may be sufficient for its departure from orbit outside the Solar System.	5.00
